Lab: Fixture superpowers

1) Project quick setup

Navigate to your boilerplate project in the terminal and run this command:

`npm i @faker-js/faker`

Verify that faker has been added to your devDependencies

---

2) Fixture file

Create a new file `/fixtures/test.fixtures.js`

```
import { test as base, expect } from '@playwright/test';
import { faker } from '@faker-js/faker';
import { HomePage } from '../../pages/HomePage.js'; //Sample value. Update to something real

export const test = base.extend({
  gotoHome: [async ({ page }, use) => {
    await page.goto('http://localhost:3000/index.html');
    await use();
  }, { auto: true }],
  homePage: async ({ page }, use) => {
    await use(new HomePage(page));
  },
  testData: async ({}, use) => {
    const factory = () => {
      const first = faker.person.firstName();
      const last = faker.person.lastName();
      return {
        name: `${first} ${last}`,
        email: faker.internet.email(),
      };
    };

    await use(factory );
  },
});
export { expect };
```
